A QR Code (it stands for "Quick Response") is a cell phone readable bar code that can store website URL's, plain text, phone numbers, email addresses and pretty much any other alphanumeric data eg. http://www.qrstuff.com
What`s a QR Code used for:

- They are used to take a piece of information from a transitory media and put it in to your cell phone.
- You may soon see QR Codes in a magazine advert, on a billboard, a web page or even on someone's t-shirt. Once it is in your cell phone, it may give you details about that business (allowing users to search for nearby locations), or details about the person wearing the t-shirt, show you a URL which you can click to see a trailer for a movie, or it may give you a coupon which you can use in a local outlet.
How does a QR Code look like?

Anyone can design a QR Code

YOU CAN DESIGN A QR CODE
The reason why they are more useful than a standard barcode is that they can store (and digitally present) much more data, including URL links and text.

The other key feature of QR Codes is that instead of requiring a chunky hand-held scanner to scan them, many modern cell phones can scan them.
What you need to be able to scan a QR Code?
